

Hot fill Solutions

Specially designed to withstand extreme conditions

ADVANTAGES

- Less preservatives & food additives
- Extended shelf life of products
- Food safety
- High quality appearance
- Recyclable
- Lighter compared to other solutions

Hot fill Solutions

Special Design & Material

Modern lifestyles lead more consumers to **“healthier” foods**, with as few additives & preservatives as possible, and to products **with longer shelf lives**.

Hot fill processing is often used to give products **extra safety**. The high temperature of the product also helps sterilize the container, allowing for extended shelf life.

Our hot fill containers are special designed to avoid deformation of the package during and after filling or in storage.

Our in-house mold design department designs products which meet **our sustainability** goals, retaining their appearance without compromising performance. Of course, our containers can also be **combined** with an **oxygen barrier** or **UV blockers**.
